Storage Network Foundations

SNIA CERTIFIED PROFESSIONAL (SCP) & CompTIA Storage+

Overview

Explosive information growth has resulted in a people shortage. Many individuals have taken storage product training. However, few people understand the breadth of storage capabilities. Still fewer understand the basic building blocks that underpin those capabilities. As a result, it is difficult to find people with an integrated literacy across storage disciplines.

Balanced technical breadth enables the storage administrator to improve problem-solving skills while gaining transferable technical depth. Broad fundamental knowledge enables the manager to understand limits and choose strategic direction. Both are no longer bound by vendor specific language, and in fact, they share a common storage industry language.

The many terms including SAN, Array, Migration, Replica and Clone, by name sound like characters in a science fiction movie. Understanding the terms composition, roles and interactions provide the foundation for developing and maintaining storage solutions. Business depends on these storage solutions. They are not just building blocks, they are put together certain ways to meet a purpose.

This course highlights storage technology in vendor neutral terms. It introduces fundamental storage capabilities and the building blocks that underpin those capabilities across storage disciplines. The setting is practical and applied to help the student participate in addressing storage issues as part of a multidisciplinary team.

Objectives

The primary objective of this course is to develop fundamental technical knowledge and skills required to understand current and emerging data storage capabilities and infrastructures. The course provides a set of practical approaches required to help new and experienced storage administrators and managers to do their job better. The objectives include:

- Basic Storage Technology
- Disk Technology
- SCSI
- FC SAN
- IP Storage
- NAS
- Virtualization
- Storage Management
- Data Management
- Continuity Management

Audience

Everyone responsible for storage service delivery and support for new and existing storage products and services; this typically includes both new and experienced development, administration, implementation, delivery, support and management staff. Staff members required to complete the internationally recognized SNIA S10-101 Storage Network Foundations examination will find this course essential.

Prerequisites

A basic level of IT literacy including at least six (6) months experience in IT and/or Storage Networking Operations. Advanced computer skills and knowledge in at least one operating system. Technical skills as a team member to develop complex solutions. A course specific non-disclosure agreement is required to attend this course.

Examination

Examinations leading to **SNIA CERTIFIED PROFESSIONAL (SCP)** are held on all continents. Possession of this certificate is mandatory for all candidates who wish to reach 'full certification' as a **SNIA CERTIFIED STORAGE NETWORKING EXPERT**.

Certificate Advantages

1. Certification insures that staff has a benchmarked level of knowledge and skill.
2. Recruiting and retention are simplified.
3. Possession of an internationally recognized competence certificate is a personal achievement that will help foster commitment and increase job satisfaction.
4. A mandatory requirement for some organizations. Customers of IT Storage Services are demanding that their suppliers have a 'license to operate'.
5. More than 2,000 professionals now hold the qualification.
